

Amendments to the Abstract

Please **add** the following Abstract to this application.

-- A method for creating a menu (~~T~~) for audio content, e.g. music tracks, uses means (~~CL~~) for classifying the audio content into clusters (~~C1,...,C3~~) of similar tracks, the similarity referring to physical, perceptual and psychological features of the tracks. The method comprises a means (~~R~~) for automatic representative selection for clusters (~~C1,...,C3~~), and a means (~~X~~) for generating thumbnail representations of audio tracks. Said audio thumbnails are associated to the menu (~~T~~). Advantageously, no graphical or textual display is required for navigation, since the user may listen to an audio thumbnail and then enter a command, e.g. by pressing an appropriate button, for either listening to the related track or a similar track belonging to the same cluster, or listening to another type of music by selecting another thumbnail representing another cluster.--
